

# Compliance Management

Ensuring process conformance throughout the organization.

With Stages' built-in compliance management capability, you can ensure your defined process models and project workflows conform to any given reference model such as CMMI® or SPICE™.

## The highlights

### Supports many maturity models & industry standards

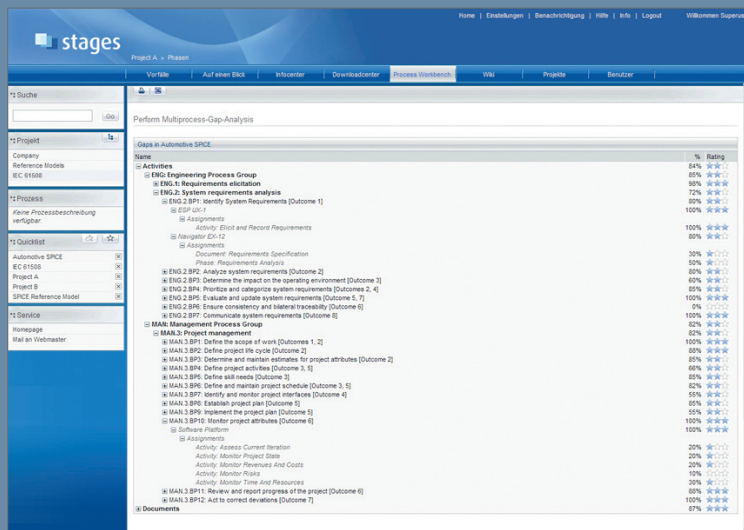

Stages lets you render processes using maturity models, industry standards, or your organization's norms. It supports CMMI, SPICE, Automotive SPICE, IEC 61508, ISO 9001, ISO TS 16949, and V-Model XT, among others.

### Ensures process conformance

An automated Gap analysis checks your organization's processes for conformance at the touch of a button.

### Enables assessments, audits, and appraisals

A single click is all it takes to retrieve information directly from projects for your certifications. This lets you do things like generate entire CMMI PIIDs to prepare for SCAMPI appraisals as well as input for SPICE assessments, including all documents!

**Focus on the essentials first**

You can introduce new standards step by step by initially focusing on select workflows.

**Role-based access to compliance reports**

Access to all compliance reports is role-based, making it very easy for you to control who may view these reports. For example, quality managers with a need to know usually get clearance; developers normally do not.

**Generate compliance reports**

Regular compliance reports help you monitor your processes' conformance. They pinpoint gaps in your process, affording you the opportunity to take measures to close these gaps.

**Reuse**

You can introduce new standards much faster by building on models that are already in use.

**Continuous process improvement**

Stages helps you identify and quickly remedy weak points in the process to support ongoing improvement efforts.
