

Process Management

Using tailored processes flexibly in projects.

Stages offers to you a smart solution for setting up and managing your processes. It helps you build a process library of your own and put it to very productive use in your projects.

The highlights

Flexible process modeling

Versatile process modeling tools and a rich selection of process elements enable you to define process structures and compile process libraries. You can use any process views to render your workflows, including EITVOX, Process Turtle, RASIC, and EPC.

Process tailoring

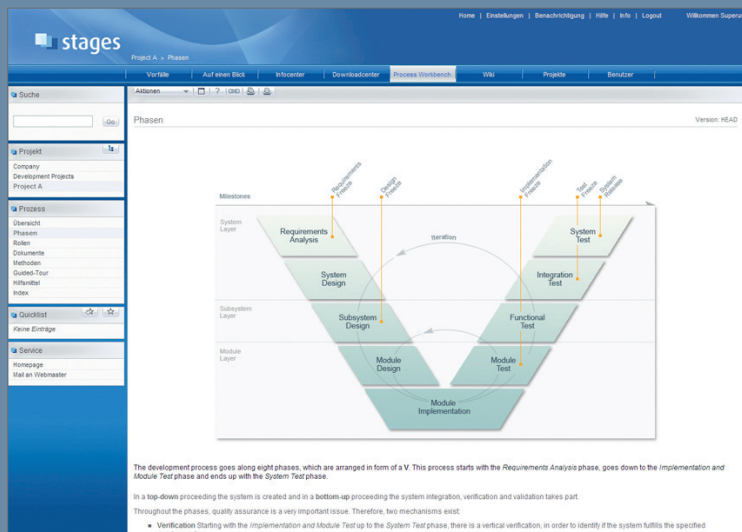

You are free to define rules for customizing each process so that every project yields a workflow that fits.

Enactment

Translate your process theory into everyday life. Stages executes your development processes as workflows for documents. It ensures access to up-to-date work results and implements process driven lifecycle management for all project work products.

Version management for processes

Stages also offers tools enabling you to track all changes and manage versions. Baselines serve to administer the different process versions. Users only ever see the approved version.

Analyzing and defining processes:

- Structure, model, and maintain development processes
- Integrate any process models using flexible meta-modeling tools
- Define and analyze process interfaces
- Check process consistency
- Generate process views (Microsoft Word®, Microsoft Excel®)
- Import ARIS process models

Rolling out processes:

- Automatically generate projects based on templates (process instantiation)
- Use approval mechanisms for the entire workflow and every process element
- Manage regional, departmental, or project-specific processes, templates, check lists, and the like decentrally
- Adapt processes to suit specific project requirements (tailoring processes)
- Use role-based views to access information
- Access project documents using process-oriented document management tools
- Use Microsoft Project Integration to automatically generate and update project plans

Improving processes:

- Source feedback for process improvements directly from the system
- Reuse proven development processes for future applications
- Effortlessly apply new versions of the underlying processes to existing projects
